

CVBS Website — Mel's Cheat Sheet

Repo: `/Users/melly_1/Apps/CVBS-SITE-MARCH2026/` **Live site:** <https://mellyanncox-ctrl.github.io/CVBS-SITE-MARCH2026/>

Deploy any change

```
bash

cd /Users/melly_1/Apps/CVBS-SITE-MARCH2026
git add .
git commit -m "describe what you changed"
git push origin main
```

Allow 1–2 mins for GitHub Pages to update.

Add or swap an image

Images live in `assets/photos/`. Reference them in HTML like:

```
html

background-image: url('assets/photos/filename.jpg')
<!-- or for <img> tags: -->

```

Rules:

- No spaces in filenames — use hyphens: `dest-gold-coast.jpg` ✓ `dest-gold coast.jpg` ✗
- Rename files with spaces in Terminal:

```
bash

mv "dest-gold coast.jpg" "dest-gold-coast.jpg"
```

- Adelaide is `.png` not `.jpg` — file extension must match exactly
 - After adding images to the folder, just `git add . && git commit && git push`
-

Edit copy (text) on a page

- 1. Open the `.html` file in a text editor (or upload to Claude)
- 2. Find the text with `Cmd+F`
- 3. Edit directly
- 4. Save, deploy

Common files:

Page	File
Home	<code>index.html</code>
Destinations index	<code>destinations.html</code>
Sydney	<code>sydney.html</code>
About	<code>about.html</code>
Services	<code>services.html</code>
How it works	<code>how-it-works.html</code>
Results	<code>results.html</code>
Submit a brief	<code>submit-a-brief.html</code>
International	<code>international.html</code>

Change a colour or style sitewide

All shared styles use CSS variables defined at the top of each file inside `:root { }`:

css

```
:root {
  --teal: #3BC9D9;          /* main brand colour */
  --teal-dark: #28A8B6;    /* hover states */
  --navy: #0D2233;         /* dark sections */
  --navy-deep: #071520;    /* footer */
  --text: #0D1F2D;         /* body text */
  --muted: #555;           /* secondary text */
}
```

If a colour appears inconsistently across pages, it means the variable isn't applied — tell Claude which element and which page to fix it.

Add a new destination card

Each card in `destinations.html` follows this pattern — copy, paste, and update the 5 highlighted values:

```
html

<div class="dest-card-full">
  <div class="dcf-photo" style="background-image:url('assets/photos/dest-CITY.jpg');
    <div class="photo-ph-inner" style="transform:scale(0.7)">
      <div class="photo-ph-ring"><div class="photo-ph-dot"></div></div>
      <div class="photo-ph-label">CITY NAME</div>
    </div>
  </div>
  <div class="dcf-body">
    <div class="dcf-name">CITY NAME</div>
    <div class="dcf-venues">XX+ venues in our network</div>
    <div class="dcf-desc">One or two sentences about this destination.</div>
    <a href="CITY.html" class="dcf-link">View CITY venues </a>
  </div>
</div>
```

Add a new page

1. Copy the closest existing page (e.g. `sydney.html`) for a new destination)
 2. Rename it (e.g. `darwin.html`)
 3. Update the `<title>` tag at the top
 4. Update the `class="active"` on the nav link to match the new page
 5. Edit the content
 6. Add a link to it from `destinations.html` or wherever relevant
 7. Deploy
-

Update the nav links

Nav is duplicated in two places in every file — the desktop nav and the mobile menu. Search for both and update together:

```
html

<!-- Desktop nav -->
<div class="nav-links">
  <a href="newpage.html">New Page</a>
  . . .
</div>

<!-- Mobile menu -->
<div class="mobile-menu" id="mobileMenu">
  <a href="newpage.html">New Page</a>
  . . .
</div>
```

If the site grows and updating nav on every page becomes a pain, that's when to ask Claude about a shared nav include or a simple JS component.

Update the footer

Same deal — footer is repeated on every page. For a sitewide footer change, either:

- Do a find-and-replace in your code editor across all `.html` files
 - Or ask Claude to update a specific footer element across all pages by uploading each file
-

Photo height adjustments

Photo heights are controlled by a `<style id="photo-height-fixes">` block near the bottom of each file. Classes to know:

Class	Where used
<code>.dcf-photo</code>	Destination index cards
<code>.dest-hero</code>	Individual destination page hero
<code>.vc-photo</code>	Venue cards
<code>.area-photo</code>	Area guide cards
<code>.oc-photo</code>	Offer cards
<code>.art-hero</code>	Blog article hero

To change a height, find the class and update the `height` value.

When to ask Claude

Bring a file to Claude when:

- You need to change something across multiple cards at once (like all the destination images)
- You're adding a new section and want it to match the existing design system
- Something looks broken on mobile
- You want to add something new (form, table, section type) you haven't built before

How to ask effectively:

1. Upload the `.html` file
2. Say what page it is and what you want changed
3. Mention where it lives in the repo if relevant
4. Download the updated file, drop it in your repo folder, deploy
